Sash Secure Cable Restrictor

Sashjack Sash Secure Window and Door Cable Restrictors

VBH now stocks Sash Secure Cable Restrictors from independent UK hardware manufacturer, Sashjack.

Sashjack have built their name on developing niche solutions to everyday problems. Their first product, the Sash Jack, is an innovative device to simplify the process of toe and heeling doors and windows. This was followed by a range of hold open and variable angle door restrictors and also a concealed door opener/closer. All of these products are available through VBH.

The latest Sashjack product addresses the area of restricting doors and windows for both safety and security reasons.

Sash Secure Window Restrictor

The window restrictor is designed primarily as a safety feature to prevent falls from windows and is available in two versions; Handle Plate and Universal Plate. The Universal Plate version features a stainless steel plate that is screw fixed to the opening sash. This

can be fitted to any window regardless of the locking mechanism or handle fitted. The Handle Plate version has a stainless steel plate that sits discreetly beneath the espagnolette handle backplate (43mm hole centres). The handle fixings pass through the plate to securely attach it to the window. Not only does this make for the appearance of less hardware on the window but also means the cable does not bow inwards at the sash end.

Both versions feature a frame block in a choice of attractive colours. Standard finishes are white, black, tan (light oak) and stainless steel. All other RAL colours are available to special order subject to order size, so the specifier/installer has the option of colour matching to the frame material or opting for a contrasting finish to highlight the restrictor. Each restrictor is fitted with a 220mm cable (any length available subject to order size), which is released by push button to allow the window to open fully. The button can be key-locked to prevent the cable being dis-engaged.

Simply everything.

Everything simple.

Sash Secure Door Restrictor

The door version is designed primarily as a security product and should be used in place of a door chain. As with the Handle Plate window restrictor the cable is attached to the sash via a laser cut stainless steel base plate that sits beneath the door handle. The standard '3070' version is designed to fit the popular short backplate 92PZ handles with the upper screw beneath the handle, such as greenteQ's short backplate Alpha and Hoppe's 3337 and 3360N types. Base plates can

be produced to suit any other door handle, such as those designed to operate Millenco, Paddock, Yale or Roto locks, subject to order quantity.

The door restrictor works with the same frame block as the window version.

The restrictors have all been independently strength tested and certificates are available from VBH if required.
